

Hard Drive to USB Transfer Tutorial

By:Edin Muminovic

Equipment used

[Link for device](#)

[Link for USB](#)

These are the devices I used for the transfer from hard drive to USB in .img file

NOTE: Remember this hard drive is a 3.5, NOT A 2.5. But that shouldn't be a problem for you if you are using the same as me, as it takes both.

Hard Drive

Step 1

You will get two things when you open the box: the connector and the power supply shown here.

Step 2

Plug the power supply into the connector.

Now you can plug the other end of the power supply into the wall outlet.

Step 3

Look for SS USB ports or blue ports. If you don't have that, it is okay, but if you do, make sure you use them because if you don't, the transfer will be really slow. Plug the connector and USB into these ports.

Step 4

Note the blue light means it is on. Now find the port on the hard drive and match it with the arrows.

When done, the hard drive will turn on.

Step 5-1 **Note: For this, use Kali Linux.**

Before we start with anything, let's first format our USB. On the left-hand side, click the dragon and search for Disks. You should see this.

Step 5-2

Select the USB drive. Then click the gears icon.

Step 5-3

Click Format Partition.

Step 5-4

When you get here, click
For use with Windows
(NTFS). We must do this
before the transfer of data;
if we don't, we will be
limited to only 4 GB files,
which is a problem. Name
it whatever you want.

Step 6

Type in the following command. This will list drives on the PC, like USB, hard drive, etc.

```
kali@kali: ~  
Session Actions Edit View Help  
(kali) [~]  
$ lsblk -o NAME,SIZE,MODEL,MOUNTPOINT
```

Step 7

Look for the USB and hard drive. As you can see, the USB is sdb1 and the hard drive is sdd. Yours might be different, so don't copy blindly.

NOTE: My hard drive is named, but yours will not be. The reason is that when I made the tutorial, I had already done everything. Yours will most likely be named Untitled.

A terminal window from a Kali Linux environment showing the output of the `lsblk -o NAME,SIZE,MODEL,MOUNTPOINT` command. The output lists several storage devices. Two white arrows with black text point to specific entries: one points to `sdb` (labeled "USB") and another points to `sdd` (labeled "HARD DRIVE").

```
Session Actions Edit View Help

(kali㉿ kali)-[~]
$ lsblk -o NAME,SIZE,MODEL,MOUNTPOINT
NAME    SIZE MODEL          MOUNTPOINT
sda     931.5G WDC WD10EZEX-60WN4A0
├─sda1   976M                /boot/efi
├─sda2  926.7G                /
└─sda3   3.9G                [SWAP]
sdb     233.1G SanDisk 3.2Gen1
└─sdb1  233.1G
sdc       0B SD/MMC/MS PRO
sdd     232.9G WDC WD2500JS-40TGB0
├─sdd1   200M
└─sdd2  232.6G
sr0     1024M hp PLDS DVDRW DU8AESH

(kali㉿ kali)-[~]
$ |
```

Step 8

Before mounting run this command
`sudo mkdir -p /mnt/evidence_usb`

Then run the white arrow command,
minus the sdb1, because I don't know
how your USB is listed.

Step 9

Run the following command. Please write it exactly as I have it, minus the `sdd`, because I don't know how your hard drive is listed.

A little bit about `dcfldd`: it is an enhanced version of GNU `dd` with features useful for forensics and security. But be careful using it, as it could wipe everything on the hard drive if you type something wrong.

You'll know it works if you see the blocks being written as it goes on. Let it keep running it could take hours. Don't touch anything, and make sure to complete Step 10.

The screenshot shows a terminal window with the command `sudo dcfldd if=/dev/sdd of=/mnt/evidence_usb/evidence.img bs=1M status=on`. Three arrows point to specific parts of the command: a white arrow points to `if=/dev/sdd`, a green arrow points to `of=/mnt/evidence_usb/evidence.img`, and a blue arrow points to `bs=1M`.

The <code>if=/dev/sdd</code> Is the hard drive	The <code>of=/mnt/evidence_usb/evidence.img</code> Is the USB and we are saving it to <code>evidence.img</code>	<code>Bs = 1M</code> Sets the block size for input and output to 1 megabyte. And <code>status=on</code> just gives status updates
---	--	--

Step 10

Click Xfce Screensaver and toggle off the screensaver. This is so your PC doesn't turn off during the transfer. Do Step 11 when everything is done transferring.

Step 11 Final step

Unmount the USB and then open it. You should see a .img file.

Note: Please do not unplug the USB before you unmount it.

USB .img file

Congratulations
You have done it.

END
